

The Significance and Valuability Of Virtualism in the Life Young People

Nematova Mokhidil A'zamjonovna

Student of the department of Philosophy Samarkand State University after named Sharaf Rashidov Samarkand, Uzbekistan

Annotation. *This article highlights how important the positive achievements of the science of virtual science, which has entered the history of humanity in the age of globalization of the 21st century, are for humanity and how it is applied to our lives, and the negative aspects should not be accepted. The meaning of the concept of virtuality is explained. It has been widely analyzed that young people should exchange information from the virtual world for the right purposes, communicate, and not be deceived by various foreign ideas..*

Keywords: *virtualize, cyberspace, virtualistics, information, cyberterrorism, ideology*

The rapid development of the process of informatization has prompted the entry of modern research known as "virtualistics" into the history of mankind, the fields of science, and the scientific thinking of society. As each new science emerged, there was a need to organize its research methods, what the object of study consists of, and this research began to be organized philosophically. As for the term "virtualistics", it goes back to the Latin word virtues. Researchers have noted the following meanings of the term virtues': moral value, goodness, goodness, imagination, courage, potentiality, unreality, etc.

An example of this is the Russian scientists N.A.Nosov and O.I.Geniratesky. Emphasis will be placed on social and health care organization, where virtual reality will definitely have an impact on human-computer interaction.

Today, as a result of the high attention paid to informatization in our society, a wide path has been opened for the application of virtualization of human activities and the production of information technologies. As an example, we can cite the views of the President of the Republic of Uzbekistan on the improvement of the electronic government system in paragraph 2.2 of the Decree on the strategy of actions for the further development of the Republic of Uzbekistan (07.02.2017). [1]

The main reason for such actions is that the virtual world has a number of conveniences: saving time and money, the possibility of exchanging information between several countries at the same time, making several payments online.

At the same time, in today's era of globalization, when people communicate freely with the help of the latest technologies, it is extremely important to implement a well-thought-out state policy in this area. In this regard, there is a need to develop our society and adapt it to the standard of the world information communication system. The decision of our first president Islam Karimov on March 21, 2012 regarding measures for further development and implementation of modern information and communication technologies defines such important tasks. This document was developed in accordance with the Law of the Republic of Uzbekistan on informatization and is

aimed at increasing the efficiency of the activities of state and economic management bodies, local authorities, and ensuring the wide use of modern information and communication technologies in the field of state and community building.

In the 21st century, which is the age of information, the degree of connection of humanity with the virtual world is increasing. The amount of information a person receives through virtual reality is increasing, and in some cases, a person is unable to process it. Only a small part of the information distributed in the virtual world is reliable, and the rest is often fake news. According to the interpretation of Professor Sh.Kushakov, "in the virtual world, it is easier to spread false information, deceive and mislead people [2.19]. The majority of such victims are young people. Because they are curious, ambitious and gullible, they are easily deceived.

The Internet is the result of scientific and technical progress. Nowadays, it is difficult to imagine our life without the Internet. The Internet has greatly facilitated communication and information exchange between people living in different parts of the world. It is convenient to communicate and exchange information via the Internet. Therefore, there are many cases of attacks on people's minds through the Internet system. "Cyberspace" is a favorable environment for such practices. Cyberspace is a virtual aggregate of the world's computer networks. Cyberterrorism is a force that can harm a person both mentally and physically in cyberspace. Cyber terrorism is the use of modern technologies, computers and other opportunities to achieve the malicious intentions of evil people. Cyber terrorism poses a serious threat to humanity. At the moment, its power is equal to the power of nuclear and chemical weapons. Of course, this is done under an anti-human ideology. In the words of Honorable Islam Karimov, in today's time, ideological landfills have more power than nuclear landfills [3.71].

It is not for nothing that it is called the 21st century of globalization. The level of importance of information has reached high levels. According to researchers, one of the problems that arose in the process of globalization is that global changes are not only limited to economic factors, but also have an impact on cultural identities. In this, we young people should only minimize the positive features of scientific achievements and not accept the negative aspects. Virtual science is a component of philosophical research, and there is a need to study its possibilities, categories, research object from a philosophical point of view. Understanding the scientific nature of the phenomenon of virtualistics is becoming an urgent problem. In order to solve the problems that have arisen, it is necessary to form concepts such as formation of ideological immunity, awareness of national minority, enrichment of spirituality among young people. As the great scholar Abu Rayhan Beruni said, Man is the highest breed, perfection of nature, the human race is higher than all animals. A great honor was given to man, he was given intelligence and strength. For this reason, in order for the spiritual world of a person to be compatible with the tasks set before him, he must be highly moral, knowledgeable, and enlightened [4.115].

In conclusion, it can be said that the advantages of using the virtual world are that it is very easy to share, receive, and process information, and it is a convenient space for communication. In addition, the transmitted information may appear without an author. This is for malicious persons. The Internet has great potential to influence the minds and emotions of young people, their way of thinking, and their behavior. Therefore, it is necessary to protect the young generation from various threats in the virtual world. I think it is necessary to awaken spirituality and patriotism in their minds. Spiritual education serves to preserve the youth of the younger generation and enrich its inner world. In order for young people to become necessary persons in our society, first of all, it is necessary to divide their time equally among the necessary tasks⁶.
